

## Application Note: 1203 Direct mV/V Calibration

### Application:

A vessel that already contains material is to be recalibrated without emptying the contents. The application uses a 1203 Weight Transmitter and is calibrated in mV/V mode using a known weight ( $W_T$ ) added to the current weight. The change in the mV/V reading when this weight is added will allow for a span calibration using direct mV/V entry to be performed. The last section of this application note demonstrates the formulas used for these calculations.

### Components:

1203  
Weight Transmitter

1203-D  
Weight Transmitter  
with display

1203-B  
PCB only Weight  
Transmitter

1203-SM  
Service Module

\*Note the 1203 is available in three formats as shown, each have the same weighing functionality and differ only in the display or housing.

\*\* The 1203-SM service module provides a display and buttons to assist in the setup of the 1203 and 1203-B. Alternately a laptop using the free Viewer software can be used to configure all devices.

**Determine mV/V readings:**

The first step is to place the 1203 in mV/V mode so as the mV/V readings can be determined for two different weights.

<p>Place 1203 display in mV/V mode to show absolute mV/V readings.</p>	<p>Press the &lt;CHANGE&gt; key repeatedly until mV/V units are lit.</p>
<p>Record absolute mV/V reading</p>	<p>R1 = _____ mV/V</p>
<p>Estimate weight of material currently in vessel:</p> <p>W1 is an estimate of the weight of material in the vessel. This lets us calculate an estimated zero point in the calibration. The absolute accuracy of the estimation is not a problem as the zero point of the vessel can be corrected manually in the future without effecting the span calibration.</p>	<p>W1 = _____ units</p>
<p>Add known Test Weight:</p> <p>Note that WT is any known weight. It may be a formal test weight or simply the addition or subtraction of a known amount of material from the vessel. In the case that material is removed it is not necessary to enter negative mV/V or weight values into the instrument – simply enter the positive numbers.</p>	<p>WT = _____ units</p>
<p>Record absolute mV/V reading:</p>	<p>R2 = _____ mV/V</p>

**1203 Calibration:**

**Span Calibration (Dir.SPN)**

Span Calibration (Dir.SPN) = (R2 – R1)

$$\begin{array}{ccccccc}
 & R2 & & R1 & & & \text{Dir.SPN mV/V} \\
 & \boxed{\phantom{000000}} & - & \boxed{\phantom{000000}} & = & \boxed{\phantom{000000}} & \\
 & & & & & & \text{WT} \\
 & & & & & & \boxed{\phantom{000000}}
 \end{array}$$

**Zero Calibration (Dir.ZER)**

Zero Calibration (Dir.ZER) = R1 – (Dir.SPN x W1 / Wτ)

$$\begin{array}{ccccccc}
 & & \text{Dir.SPN mV/V} & & W1 & & W1 \\
 & & ( \boxed{\phantom{000000}} & \times & \boxed{\phantom{000000}} & / & \boxed{\phantom{000000}} ) \\
 R1 & & = & & & & \\
 \boxed{\phantom{000000}} & - & \boxed{\phantom{000000}} & & & & \\
 = & & & & & & \\
 \text{Dir.ZER mV/V} & & & & & & \\
 \boxed{\phantom{000000}} & & & & & & 
 \end{array}$$

**Enter values into 1203**

- Enter the (Dir.SPN) value when prompted for mV/V (R2 – R1)
- Enter the Wτ value when prompted for weight Wτ
- Enter the Dir.ZER value directly into the 1203. Dir.ZER
